The R Project for Statistical Computing

Getting Started

R is a free software environment for statistical computing and graphics. It compiles and runs on a wide variety of UNIX platforms, Windows and MacOS. To [download R](#), please choose your preferred [CRAN mirror](#).

If you have questions about R like how to download and install the software, or what the license terms are, please read our [answers to frequently asked questions](#) before you send an email.

News

- **R version 4.2.2 (Innocent and Trusting) prerelease versions** will appear starting Friday 2022-10-21. Final release is scheduled for Monday 2022-10-31.
- **R version 4.2.1 (Funny-Looking Kid)** has been released on 2022-06-23.
- **R version 4.1.3 (One Push-Up)** was released on 2022-03-10.
- Thanks to the organisers of useR! 2020 for a successful online conference. Recorded tutorials and talks from the conference are available on the [R Consortium YouTube channel](#).
- You can support the R Foundation with a renewable subscription as a [supporting member](#)

eclipse (StatET)

The screenshot shows the Eclipse IDE running RStudio. The Project Explorer on the left displays a file tree with folders like 'bonn-2022-intro', 'data', and 'Folien'. The Editor in the center shows the R code for 'FolienRKurs-12.Rmd', which includes comments about RStudio and R as a calculator, and a plot command. The Console at the bottom shows the R startup message. The right pane displays a scatter plot of Sepal.Length vs Petal.Length for the Iris dataset.

The screenshot shows a Stack Overflow page for a question titled "P-values from aov in R". The question is asked 7 years, 1 month ago and modified 6 years, 10 months ago. It has been viewed 2k times. The question text describes a simulation study in R using the `aov` function and difficulty extracting p-values. The user provides R code: `results <- summary(aov(dv={A*B*C*D*E}*Error(subj)/(A*B*C*D)), data = mdata)) # con`. The output shows ANOVA tables for 'Error: subj' and 'Error: subj:A'. The user mentions truncating the output and wanting a list of p-values with effect names (A or A:E). A partial R function `get_p` is shown at the bottom.

P-values from aov in R

Asked 7 years, 1 month ago Modified 6 years, 10 months ago Viewed 2k times

stackoverflow Take this month's Pulse Survey Take the survey

I'm conducting a simulation study in R. Basically, I generate fake data sets and then run an ANOVA on the data using the `aov` function. But I'm having difficulty extracting p-values. Previous questionss do not help ([Extract p-value from aov](#)) -- I am running a mixed ANOVA.

First I have an ANOVA:

```
results <- summary(aov(dv={A*B*C*D*E}*Error(subj)/(A*B*C*D)), data = mdata)) # con
```

which generate this output:

```
Error: subj
  Df Sum Sq Mean Sq F value Pr(>F)
E    1 1039157 1039157    0.95  0.334
Residuals 58 63428016 1093586

Error: subj:A
  Df Sum Sq Mean Sq F value Pr(>F)
A    1 1996 1996    0.229  0.641
A:E    1 2294 2294    0.253  0.617
Residuals 58 526389 9076

...
```

I'm truncating the output for space. What I want list of p-values with the effect name (A or A:E). I have halfway succeeded, but it's messy. I can extract the p-values using this `get_p` function that I made.

```
#Function
get_p = function(results,headIf
```
